

The Hydrologic Cycle

INFILTRATION

Infiltration refers to water soaking into the ground:

RUNOFF

Runoff refers to the water that is not evaporated, and that does not soak into the ground. It is the water we find in streams.

Runoff occurs during seasons of high and relatively low

In areas where there is a lot of runoff during one part of the year.....

and dry and warm during another part of the year.....

can be built to store (or **reserve**) the runoff for an “un-rainy day”
